

1 ABSTRACT

2 A cap and container assembly can be opened and closed
3 repeatedly and continue to achieve a good seal between the cap
4 and the container. The good seal results from the engagement, of
5 the container neck with cap protrusions, which temporarily
6 deforms the shape of the container and/or the cap as the cap is
7 secured to the container, and from stopping surfaces which limit
8 the extent of that deformation.
